Formspree setup and form submission

Formspree form endpoint created for the contact page.

Confirmation shown after submitting the form on the contact page.

Email received at agolds12@syr.edu containing the submitted form data.

Reflection

What questions did you have about the lab?

I wasn't sure at first whether the relative paths exercise meant I needed to build those folders in my own repository, or whether it was just a worksheet. I also didn't understand why my HTML file wouldn't open in a browser it turned out the file was missing its .html extension, so my Mac kept opening it in TextEdit instead.

What was the hardest part of the lab?

Debugging small syntax errors. An unclosed <textarea> tag swallowed everything after it on the page, and a one-letter typo (<imnput> instead of <input>) broke the submit button. Both were single-character mistakes that took down the entire form, which made them hard to spot. Pushing to GitHub was also a struggle a leftover lock file in the repository blocked the commit until it was deleted.

3 honestly it went smoother than I thought I did have to read the directions multiple times and refer back to my notes and took it slow but went good
